J. GORDON HANNA

The 77th Report on  
FOOD FROM CONNECTICUT MARKETS AND FARMS  
1972

J. Gordon Hanna, Chief Chemist

Annual bulletins have been published since 1896 by this Station showing the examination results for food offered for sale in Connecticut. These publications of the data for open market purchases are a deterrent to fraud and deception. Consumers are invited to use this information to help them compare and then select the most reliable brands and suppliers.

The arrangement of this bulletin has been changed somewhat from that of the 1971 bulletin. The main divisions remain as an alphabetical listing of the Connecticut communities from which samples of food have been collected. Designations of the food sampled arranged by type and brand follow; then the sources are given. The purpose of this arrangement is to make the information concerning the brands of food and the dealers in the reader's immediate vicinity readily available for assessment of relative reliabilities.

Statutory authority for the collection of samples and the prosecution of violators rests with the Commissioners of the State Department of Consumer Protection and the State Department of Agriculture. Only official samples submitted by inspectors from these departments are included in this bulletin. The analytical results have been made available to the Commissioners as soon as possible to aid them in enforcement. This Station has no authority to prosecute violators.

It should be understood that random sampling is not implied. Many food samples were collected because they were already suspect either by inspectors or by consumers. The result is that the ratio of the number of samples deficient to the total number examined is probably higher than it would be if the sampling had been random.

This bulletin contains the itemized examination results for 3043 samples, 341 more samples than in the 1971 bulletin. Sixty-eight samples of milk submitted for Vitamin D assay and 544 samples of milk submitted for chlorinated pesticide residue analyses are not included. All the Vitamin D milk samples conformed to the requirement of 400 USP units of Vitamin D per quart. None of the milk samples contained residues in excess of established tolerances. The significance of traces of residues in milk and other foods is evaluated by comparison with official levels established and periodically reviewed by the U. S. Department of Health, Education and Welfare. The established tolerance levels include at least a 100-fold safety factor, determined by physiological effects of each pesticide on test animals.

Analysis for adulteration or for conformance to label claims was in many cases the basis for deciding whether or not samples were acceptable. In other cases examinations of products for conformance to Connecticut and Federal definitions and standards of identity were used. Some of the latter requirements, which normally do not prescribe label declarations of the ingredients, may be helpful in interpreting the data given.

Frankfurters and bologna are limited to not over 3.5 percent fillers (such as cereal, starch, soy products and nonfat dry milk), 10 percent added water, and 200 parts per million nitrite. Hamburg must not contain more than 30 percent fat, and pork sausage not more than 50 percent fat. The addition of sulfur dioxide (sulfite) to any meat product is forbidden. Egg noodles must contain at least 5.5 percent solids of egg or egg yolk. In general, a product is considered misbranded if the average of weight, measure or numerical count of the contents of six or more packages does not fully equal that stated on the package label.

Organoleptic tests made on some of the samples involve the use of sense organs. These tests, normally conducted by a panel of three or more, evaluate the odor, taste and appearance of the food.

The analytical work represented by this report was performed by R. Barger, R. G. Botsford, W. Glowa, L. Hankin, J. J. Hayes, L. G. Hornig, L. G. Keirstead, J. Langston, L. A. McLean, G. Smith, S. R. Squires, R. E. West and A. Wickroski. Clerical work and reporting were by B. Lindgren. The bulletin was typed by C. J. Miller.

A portion of the cover page and the letter of transmittal of the first Station food report appears on the back cover of this Bulletin.
