Technical Bulletin 20

May 2019

Official 321 vegetable, crop and lawn seed samples were collected by inspectors from the Bureau of Regulation and Inspection of the Connecticut Department of Agriculture for testing in 2018. As the official seed testing laboratory, The Connecticut Agricultural Experiment Station performed germination and purity analyses of the seed samples for compliance with the Connecticut Seed Law Regulations and the Federal Seed Act. Seed tests and analyses were conducted by following the Association of Official Seed Analysts (AOSA) Rules for Testing Seeds.

Among 306 vegetable samples, eight samples were not tested for seed germination rates because there were not enough seeds in the samples (Table 1). The results of the test for the rest of vegetable seed samples showed that 283 samples passed the germination test, but the other 15 samples did not meet their label claims and the Federal standard, in which, eight samples did not have enough seed for retesting (Table 1). Summarized by seed sources, one or more vegetable seed samples from all seed companies failed germination tests except the seed samples from Seedway LLC and The Page Seed Co. (Table 2). Grouped by vegetable species, chive, lima bean, and parsnip seeds showed poor germination rates compared to the other species (Table 3). Seed samples were examined for prohibited noxious weed seeds and no vegetable samples contained noxious weed contaminants.

All night crop seed samples were tested for purity and germination rates except the Australian Winter peas in the Plotspike Forage Feast sample and Daikon radish in the Soil Builder Plus Mix sample were not included in the germination test because they did not have enough seed for the test (Table 4). In purity tests, Oat LA 99016 and Australian Winter peas in the Plotspike Forage Feast sample and VNS Hairy Vetch in the Soil Builder Plus Mix sample did not meet the label claims (Table 4). The other samples met purity label claims or passed the tests within acceptable tolerances (Table 4). VNS Hairy vetch in the Soil Builder Plus Mix and the rye sample from Robert Mosher Transport Inc. failed seed germination tests (Table 4). All other samples passed the germination test except the two samples that had not enough seed for the test. No noxious weed seeds were found in the crop seed samples.

A total of six lawn grass seed and seed mix samples were tested for purity and germination rates. Because most lawn seed samples were labeled with several varieties within a species or several species within a genus, purity and germination rates were tested in the combination of a genus and reported as the sums for the purity test and means for the germination test. The results of the tests showed that three seed or seed mix samples passed both purity and germination tests by meeting the label claims or passing the tests within acceptable tolerances, but the other samples had one or more ingredients did not meet the label claims (Table 5). In the Agway Conservation Green Mixture, all ingredients met the label claims with the exception of white clover that did not meet the germination label claim (Table 5). In the Blue Seal Early Green Lawn Mixture, the purity of the VNS perennial ryegrass did not meet the label claim (Table 5). In the Blue Seal Shady Lawn Mixture sample, Gator 3 perennial ryegrass did not meet the purity claim and bluegrass and Chewings fescue did not meet the germination claims (Table 5). In the Blue Seal Classic Lawn Mixture, creeping red fescue did not meet the label claim (Table 5).

Official seed samples were collected by Wayne Nelson and Kate Ciarletta at the Connecticut Department of Agriculture. The Seed Law is administered by the Seed Control Official for the Commissioner of the Department of Agriculture.

Table 1. Results of germination rates of vegetable seed samples in comparison to label claims
