## Introduction

This data book presents the first ever detailed information of Connecticut residents' injury-related emergency department (ED) visits. It is based on hospital discharge data (Connecticut Health Information Management & Exchange – CHIME data) received from the Connecticut Hospital Association and is specific to emergency department treat-and-release visits only from 2000 - 2004. (For analysis methods, see the Technical Notes).

Injury-related ED visits in Connecticut are a major component of overall hospital ED visits. In 2000 and 2001, 31% of all ED visits were injury-related, while that number was 30% in 2002 and 29% in 2003 and 2004. Overall, almost one-third of the Connecticut ED visits were due to injuries, similar to the national estimates (28%) by the National Ambulatory Medical Survey – Emergency Department (NHAMCS-ED).<sup>1</sup> During this period, hospital EDs treated more than one and a half million injury events among Connecticut residents. The majority of these injuries were overwhelmingly unintentional injuries (93%; 1,544,975). One-quarter (24.8%) of these injuries were from falls, and hence were the overall leading cause of injury-related ED visits, followed by struck by/against injuries (13.9%), motor vehicle crashes injuries (11.7%), overexertion injuries (10.5%) and cut/pierce injuries (10.2%). About 12% of injuries were unspecified as to their cause.

### Key Findings

- There were 1,666,084 injury-related emergency department (ED) visits in Connecticut between 2000 – 2004, with an average of 333,217 injuries per year (This represents the number of injury events, not the number of persons injured)
- During the five-year period, 93% (1,544,975) of injury-related ED visits were unintentional injuries, and 3.8% (62,627) were intentional injuries
- Almost three-fourths (71.1%) of all injury-related ED visits in Connecticut were due to four causes: falls (24.8%), struck by / against (13.9%), motor vehicle crashes (11.7%) and overexertion (10.5%)
- The highest rates of injury-related ED visits were among young adults 20 – 24 years (14,466.1 per 100,000 population), followed by youths 15 – 19 years (14,325.0 per 100,000 population) and adults 25 – 29 years (13,357.4 per 100,000 population)
- More males (908,449; 54.5%) than females (757,635; 45.5%) went to the ED for injuries. The age-adjusted rates of all-injury related ED visits for males (10,948.7 per 100,000 population) were 26% higher than for females (8,677.2 per 100,000 population)
  - The three leading causes of all injury-related ED visits for females were falls (28.9%), motor vehicle crashes (13.3%) and overexertion (10.9%)
  - The three leading causes of all injury-related ED visits for males were falls (21.4%), unintentional struck by/against (16.5%) and unintentional cut/pierce (12.1%)
- The leading causes for age group 0 – 24 years were falls (24.7%), unintentional struck by/against (19.3%) and motor vehicle crashes (10.6%); and the leading for age group 25 – 64 years were falls (19.3%), motor vehicle crashes (13.8%) and overexertion (13.1%). Over half (52.9%) of all injury-related ED visits for age group 65+ years were due to falls, followed by motor vehicle crashes (6.2%) and unintentional cut/pierce (6.0%)

---

<sup>1</sup> Fingerhut 2007

- The leading causes of injury-related ED visits for Non-Hispanic Whites were falls (25.9%), struck by/against (14.5%) and overexertion (11.1%); the leading causes for Non-Hispanic Blacks were motor vehicle crashes (18.9%), falls (18.3%) and unintentional struck by/against (12.6%); and the leading causes for Hispanics were falls (21.6%), motor vehicle crashes (13.8%) and unintentional struck by/against (12.3%)
- Injury-related ED visit rates for Non-Hispanic Blacks (10,741.5 per 100,000 population) and Hispanics (11,019.4 per 100,000 population) were 52% and 56%, respectively, higher than for Non-Hispanic Whites (7,057.7 per 100,000 population)
- **For the five-year period, the total hospital ED charges for all injuries were \$1,012,371,816, with an average charge of \$429 per injury-related ED visit**

## Unintentional Injury Emergency Department Visits

- There were 1,544,975 unintentional injury-related emergency department (ED) visits in Connecticut between 2000 – 2004, an average of 308,995 unintentional injuries per year
- More than three-fourths (76.6%) of unintentional injury-related ED visits were due to five causes: falls (26.7%), struck by/against (14.9%), motor vehicle crashes (12.6%), overexertion (11.3%) and cut/pierce (11.0%)
- The highest rates of unintentional injury-related ED visits were among youth 15 -19 years (12,940.5 per 100,000 population), followed by young adults 20 – 24 years (12,881.2 per 100,000 population) and children 1 - 4 years (12,579.4 per 100,000 population)
- More males (841,995; 54.5%) than females (702,980; 45.5%) went to the ED for unintentional injuries. The age-adjusted rates of unintentional injury-related ED visits for males (10,137.8 per 100,000 population) were 26% higher than for females (8,037.9 per 100,000 population)
- Unintentional injury-related ED visit rates for Non-Hispanic Blacks (9,559.1 per 100,000 population) and Hispanics (9,927.5 per 100,000 population) were 44% and 50%, respectively, higher than for Non-Hispanic Whites (6,635.5 per 100,000 population)
- For the five-year period, the total hospital ED charges for all unintentional injuries were \$920,654,961, with an average charge of \$425 per unintentional injury-related ED visit
- The *Healthy People 2010* objective of nonfatal unintentional injuries is to reduce the rate of emergency department visits for such injuries to 9,000 per 100,000 population by 2010. The age-adjusted unintentional injury-related ED visit rate in CT for 2000 - 2004 is 9,112.1 per 100,000 population
- **The highest total hospital ED charges account for the five highest causes of unintentional injury-related ED visits: falls (\$297,495,446), motor vehicle traffic crashes (\$159,889,890), struck by/against (\$120,387,755), overexertion (\$83,815,672) and cut/pierce (\$81,306,731)**

## Falls

- Unintentional falls were the leading cause of injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 413,141 events of fall-related injuries with an average of 82,628 per year; falls were responsible for approximately one-quarter of all injury-related ED visits, and were the leading cause of injury-related ED visits for 0 - 14 years and 35 - 85+ years
- Slipping, tripping and stumbling (32.3%) were the highest cause of fall-related injuries, followed by falls from stairs/steps (11.9%) and sports-related falls (6.9%). Unfortunately, almost 40% of the falls were not classified as to cause, limiting the usefulness of these data for planning interventions to help prevent future falls
- Forty-two percent of fall injuries occurred in 0 – 24 years old age group, 37.5% in the 25 – 64 years and 20.7% in the 65+ years
- The highest rates of fall-related ED visits were among adults 85+ years (7,435 per 100,000 population), followed by children 1 – 4 years (5,234.4 per 100,000 population) and adults 80 – 84 years (4,817.5 per 100,000 population)
- Slipping, tripping and stumbling rates were highest among the elderly 85+ years (2,810.2 per 100,000 population), followed by adults 80 – 84 years (2,052.2 per 100,000 population) and adults 75 – 79 (1,079.5 per 100,000 population)
- Fall rates from bed/wheelchair/furniture were highest among adults 85+ years (1,045.0 per 100,000 population), followed by toddlers <1 year (932.9 per 100,000 population) and children 1 – 4 years (866.3 per 100,000 population)
- Fall rates from stairs/steps were highest among children 1 – 4 years (550.1 per 100,000 population), followed by toddlers <1 year (427.8 per 100,000 population) and adults 25 – 29 years ( 385.4 per 100,000 population)
- More males 0 – 19 years than females were treated for fall-related injuries, but the pattern changed later in middle and older ages, where more females than males were seen in the ED. The age-adjusted rates of fall-related injuries for females (2,361.1 per 100,000 population) and males (2,343.3 per 100,000 population) were not statistically different
- Fall-related ED visit rates for Non-Hispanic Blacks (1,966.1 per 100,000 population) and Hispanics (2,385.5 per 100,000 population) were 7% and 30%, respectively, higher than for Non-Hispanic Whites (1,829.2 per 100,000 population)
- **For the five-year period, the total hospital ED charges for fall-related injuries were \$297,495,446, with an average charge of \$526 for each fall-related injury ED visit**

## Struck by / Against

*“Injury resulting from being struck by (hit) or crushed by a human, animal or inanimate object or force other than a vehicle or machinery; injury caused by striking (hitting) against a human, animal or animate objects or force other than a vehicle or machinery” (WISQARS definition, <http://www.cdc.gov/ncipc/WISQARS>)*

- Unintentional struck by / against injuries were the second leading cause of injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 230,861 events of struck by / against injuries with an average of 46,172 per year
- More than half (58.9%) of these injuries were due to “other striking against” -- a vague category of limited assistance in determining the necessary preventive measures—followed by sports-related injuries (24.9%) and falling objects (9.3%)
- Fifty-nine percent of struck by/against injuries occurred in 0 – 24 years old age group, 37.6% in the 25 – 64 years and 3.8% in the 65+ years
- The highest rates of struck by/against ED visits were among children 10 – 14 years (3,164.5 per 100,000 population), followed by youth 15 – 19 years (2,921.7 per 100,000 population) and children 1 – 4 years (2,129.3 per 100,000 population)
- Struck by/against injury rates for sports-related activities were highest among children 10 – 14 years (1,612.5 per 100,000 population), followed by youth 15 – 19 years (1,476.2 per 100,000 population) and young adults 20 - 24 years (403.9 per 100,000 population). Struck by/against injury rates from furniture/other objects were highest among children 1 – 4 years (365.7 per 100,000 population), followed by 5 – 9 years (184.4 per 100,000 population) and children 10 – 14 years (146.3 per 100,000 population)
- More males than females were treated for struck by / against injuries for 0 – 74 year olds, but there were slightly increased injuries for females aged 75+ years. The age-adjusted rates of struck by/against injuries for males (1,797.6 per 100,000 population) were 87% higher than for females (959.4 per 100,000 population)
- Struck by/against injury rates for Non-Hispanic Blacks (1,355.9 per 100,000 population) and Hispanics (1,360.2 per 100,000 population) were 32% and 33%, respectively, higher than for Non-Hispanic Whites (1026.4 per 100,000 population)
- For the five-year period, the total hospital ED charges for struck by/against injuries were \$120,387,755, with an average charge of \$414 for each struck by/against injury-related ED visit

## Motor Vehicle Traffic

- Unintentional motor vehicle traffic injuries were the third leading cause of injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 195,237 events of motor vehicle traffic injuries with an average of 39,047 per year
- Motor vehicle occupants accounted for 85.5% (166,920) of these injuries, followed by other/ unspecified persons (6.8%; 13,311) – a vague category –, pedestrians (3.7%; 7,206) and motorcyclists (2.8%; 5,503)
- Thirty-eight percent of motor vehicle traffic injuries occurred in the 0 – 24 year old age group, 56.9% in the 25 – 64 years and 5.1% in the 65+ years
  - 7.4% of these injuries occurred in children 14 years and under
  - 14.9% and 15.7% of these injuries occurred in age groups 15 - 19 and 20 – 24 year, respectively
- The highest rates of motor vehicle crashes were among young adults 20 – 24 years (3,033.5 per 100,000 population), followed by youth 15 – 19 years (2,522.7 per 100,000 population) and adults 25 – 29 years (1,735.3 per 100,000 population)
- Motor vehicle crash rates involving occupants were highest among young adults 20 – 24 years (2,637.6 per 100,000 population), followed by youth 15 – 19 years (2,228.3 per 100,000 population) and adults 25 – 29 years (2,008.0 per 100,000 population). Rates for pedestrians were highest among youth 15 – 19 years (84.7 per 100,000 population), followed by young adults 20 – 24 years (75.8 per 100,000 population) and adults 25 – 29 years (59.6 per 100,000 population). Motorcyclist injury rates were highest among young adults 20 – 24 years (97.8 per 100,000 population), followed by adults 25 – 29 years (83.2 per 100,000 population) and adults 30 – 34 years (60.6 per 100,000 population)
- More females than males were treated for motor vehicle crash injuries from 10 – 79 years old, but there were slightly increased injuries for males than females among 1 – 4 and 80+ years old. The age-adjusted rates of motor vehicle crashes for females (1,204.7 per 100,000 population) were 5% higher than for males (1,148.1 per 100,000 population)
- Motor vehicle crash injury rates for Non-Hispanic Blacks (2,034.6 per 100,000 population) and Hispanics (1,522.2 per 100,000 population) were three-times and two-times, respectively, higher than for Non-Hispanic Whites (680.5 per 100,000 population)
- The *Healthy People 2010* objective for nonfatal injuries caused by motor vehicle crashes is to reduce the burden of this type of injury to 933 per 100,000 population by 2010. The age-adjusted injury-related ED visit rate for motor vehicle crashes in CT for 2000 – 2004 is 1,175.6 per 100,000 population
- **For the five-year period, the total hospital ED charges for motor vehicle crash injuries were \$159,889,890, with an average charge of \$481 for each motor vehicle crash injury-related ED visit**

## Overexertion

*“Working the body or a body part too hard, causing damage to muscle, tendon, ligament, cartilage, joint or peripheral nerve (e.g., common cause of strains, sprains, and twisted ankles). This category includes overexertion from lifting, pushing or pulling, or from excessive force.” (WISQARS definition, <http://www.cdc.gov/ncipc/WISQARS>)*

- Unintentional overexertion injuries were the fourth leading cause of injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 175,066 events of overexertion-related injuries with an average of 35,013 per year
- Thirty-five percent of overexertion injuries occurred in 0 – 24 years old age group, 60.4% in the 25 – 64 years and 4.6% in the 65+ years
- The highest rates of overexertion-related ED visits were among adults 25 – 29 years (1,833.3 per 100,000 population), followed by 20 – 24 years (1,706.4 per 100,000 population) and 30 – 34 years (1,672.8 per 100,000 population)
- More males than females were treated for overexertion/strenuous movement injuries for 15 – 49 years olds, but there was a slight increase for females versus males among 0 – 14 year and 50+ year olds. The age-adjusted rates of overexertion injuries for males (1,111.5 per 100,000 population) were 15% higher than for females (967.9 per 100,000 population)
- Overexertion injury rates for Non-Hispanic Blacks (1,143.1 per 100,000 population) and Hispanics (1,159.7 per 100,000 population) were 46% and 48%, respectively, higher than for Non-Hispanic Whites (783.2 per 100,000 population)
- **For the five-year period, the total hospital ED charges for overexertion injuries were \$83,815,672, with an average charge of \$402 for each overexertion injury-related ED visit**

## Cut / Pierce

*“Injury resulting from an incision, slash, perforation, or puncture by a pointed or sharp instrument, weapon or object. This category does not include injury from being struck by or against a blunt object or bite wounds; these injuries fall in the category ‘struck by/against’.” (WISQARS definition, <http://www.cdc.gov/ncipc/WISQARS>)*

- Unintentional cut / pierce injuries were the fifth leading cause of injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 169,891 events of cut / pierce injuries with an average of 33,978 per year
- Almost two-thirds (65.1%) of these injuries were due to other/unspecified objects (a vague category of limited assistance in determining the necessary preventive measures), followed by knife/sword/dagger (21.0%), non-powered hand tools (6.8%), powered tools (5.1%) and hypodermic needle (2.0%)
- Cut / pierce injuries occurred in higher numbers in the middle age groups. Thirty-seven percent of these injuries occurred in the 0 – 24 year old age group, 60.4% in the 25 – 64 year and 5.8% in the 65+ year groups
- The highest rates of cut / pierce injuries were among young adults 20 – 24 years (1,682.7 per 100,000 population), followed by adults 25 – 29 years (1,593.4 per 100,000 population) and adults 30 – 34 years (1,400.2 per 100,000 population)
- Cut / pierce injury rates by knife/sword/dagger were highest among young adults 20 – 24 years (412.2 per 100,000 population), followed by adults 25 – 29 years (380.1 per 100,000 population) and adults 30 – 34 years (333.6 per 100,000 population).
- Cut / pierce injury rates from non-powered hand tools were highest among adults 25 – 29 years (98.8 per 100,000 population), followed by adults 30 – 34 years (97.6 per 100,000 population) and 35 – 39 years (97.5 per 100,000 population).
- Injury rates from the powered tools were highest among adults 35 – 39 years (83.7 per 100,000 population), followed by adults 30 – 34 years (81.1 per 100,000 population) and 40 – 44 years (75.2 per 100,000 population).
- Cut/pierce rates from hypodermic needle were highest among adults 25 – 29 years (59.5 per 100,000 population), followed by 30 – 34 years (46.7 per 100,000 population) and 35 – 39 years (36.9 per 100,000 population)
- More males than females were treated for cut / pierce injuries through out the lifespan. The age-adjusted rates of cut / pierce injuries for males (1,322.1 per 100,000 population) were 90% higher than for females (697.3 per 100,000 population)
- Cut/pierce injury rates for Non-Hispanic Blacks (861.5 per 100,000 population) and Hispanics (1,048.7 per 100,000 population) were 11% and 35%, respectively, higher than for Non-Hispanic Whites (774.2 per 100,000 population)
- **For the five-year period, the total hospital ED charges for cut/pierce injuries were \$81,306,731, with an average charge of \$ 374 for each cut/pierce injury-related ED visit**

## Traumatic Brain Injury (TBI)

- Traumatic Brain Injuries (TBI) resulted in 72,671 injury-related emergency department (ED) visits between 2000 – 2004, or 14,534 a year
- The leading mechanism for TBI injuries was falls at 44.9%, followed by struck by/against at 21.9%, motor vehicle traffic crashes at 16.6%, assault at 8%, and other pedal cyclist at 2.7%
- Fifty-six percent of TBI injuries occurred in the 0 – 24 years old age group, 31.1% in the 25 – 64 year and 12.8% in the 65+ year groups
  - 36% of these injuries occurred in children 14 year olds and under
  - 12.5% and 7.6% of these injuries occurred in age groups 15 - 19 and 20 – 24 year, respectively.
- The highest rates of TBI-related injuries were among toddlers <1 year (1,331.6 per 100,000 population), followed by children 1 – 4 years (1,087.7 per 100,000 population) and older adults 85+ years (893.6 per 100,000 population)
- TBI rates caused by falls were highest among toddlers <1 year (1,135.7 per 100,000 population), followed by adults 85+ years (821.2 per 100,000 population) and children 1 – 4 years (763.8 per 100,000 population)
- TBI rates caused by struck by/against were highest among youth 15 – 19 years (249.2 per 100,000 population), followed by children 1 – 4 years (232.1 per 100,000 population) and 10 – 14 years (218.6 per 100,000 population).
- TBI injury rates caused by motor vehicle crashes were highest among youth 15 – 19 years (211.1 per 100,000 population), followed by young adults 20 – 24 years (193.1 per 100,000 population) and adults 25 – 29 years (133.1 per 100,000 population).
- TBI injury rates caused by assault were highest among adults 20 – 24 years (114.5 per 100,000 population), followed by youth 15 – 19 years (110.9 per 100,000 population) and adults 25 – 29 years (73.7 per 100,000 population). Overall, children, older adolescents, and adults ages 75 years and older were more likely to sustain TBI injuries
- More males than females were treated for TBI-related injuries among 0 – 64 years old, and more females than males among 75+ years. The age-adjusted rates of TBI-related injuries for males (508.1 per 100,000 population) were 46% higher than for females (349.0 per 100,000 population)
- TBI-related injury rates for Non-Hispanic Blacks (421.0 per 100,000 population) and Hispanics (451.0 per 100,000 population) were 37% and 47%, respectively, higher than for Non-Hispanic Whites (307.4 per 100,000 population)
- **For the five-year period, the total hospital ED charges for TBI-related injuries were \$85,144,836, with an average charge of \$420.5 for each TBI injury-related ED visit**

## Intentional Injury Emergency Department Visits

- There were 62,627 intentional injury-related emergency department (ED) visits in Connecticut between 2000 – 2004, an average of 12,525 injuries per year
- More than 82% of intentional injury-related ED visits were due to assault, followed by self-inflicted/suicide attempt (13.8%) and legal intervention (4.1%)
- The highest rates of intentional injuries were among young adults 20 – 24 years (1,163.5 per 100,000 population), followed by youth 15 – 19 years (1,043.7 per 100,000 population) and adults 25 - 29 years (844.4 per 100,000 population)
- More males (39,263; 62.7%) than females (23,364; 37.3%) went to the ED for intentional injuries. The age-adjusted rates of intentional injury-related ED visit for males (480.6 per 100,000 population) were 68% higher than for females (286.5 per 100,000 population)
- Intentional injury-related ED visit rates for Non-Hispanic Blacks (771.7 per 100,000 population) and Hispanics (703.6 per 100,000 population) were four times higher than for Non-Hispanic Whites (186.6 per 100,000 population)
- **For the five-year period, the total hospital ED charges for all intentional injuries were \$56,816,716, with an average charge of \$597 per intentional injury-related ED visit; the highest total hospital charges for intentional injury-related ED visits was assault (\$44,054,115), followed by self-harm (\$11,015,909) and legal intervention (\$1,746,692)**

## Self-inflicted/suicide attempt

- Self-inflicted injuries were the second leading cause of intentional injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 8,654 events of self-inflicted injuries with an average of 1,731 per year
- More than half (59.9%) of these injuries were due to poisoning (poisoning by drugs at 54.5% and poisoning by gas and other at 5.3%), followed by cut/pierce (25.3%) and suffocation/hanging (1.5%); the mechanism was not specified in the coding for 11.8% of self-inflicted injuries
- The highest rates of self-inflicted injuries were among youth 15 – 19 years (183.8 per 100,000 population), followed by young adults 20 - 24 years (129.6 per 100,000 population) and adults 25 – 29 years (90.5 per 100,000 population)
- Self-inflicted injury rates by poisoning drugs were highest among youth 15 – 19 years (102 per 100,000 population), followed by young adults 20 – 24 years (66.4 per 100,000 population) and adults 25 – 29 years (50.0 per 100,000 population).
- Self-inflicted injury rates caused by poisoning gas and other were highest among youth 15 – 19 years (6.4 per 100,000 population), followed by young adults 20 – 24 years (4.8 per 100,000 population) and adults 40 – 44 years (4.7 per 100,000 population).
- Self-inflicted injury rates caused by cut/pierce injuries were highest among youth 15 – 19 years (46.6 per 100,000 population), followed by young adults 20 – 24 years (35.6 per 100,000 population) and adults 25 – 29 years (24.3 per 100,000 population)
- More females (56.6%; 5,035) than males (41.8%; 3,619) were treated for self-inflicted injuries. The age-adjusted rates of self-inflicted injuries for females (61.6 per 100,000 population) were 40% higher than for males (44.1 per 100,000 population)
- Self-inflicted injury rates for Non-Hispanic Blacks (40.4 per 100,000 population) and Hispanics (67.7 per 100,000 population) were 3% and 72%, respectively, higher than for Non-Hispanic Whites (39.3 per 100,000 population)
- **For the five-year period, the total hospital ED charges for self-inflicted injuries were \$11,015,909, with an average charge of \$1,138 for each self-harm injury-related ED visit. Self-harm injuries had the highest ED charges per case compared to all other injuries**

## Assault

- Assault-related injuries were the leading cause of intentional injury-related emergency department (ED) visits in Connecticut from 2000 – 2004. For the five-year period, there were 51,402 events of assault injuries with an average of 10,280 per year
- More than half (58.7%) of these injuries were due to struck by/against (by unarmed fight/brawl at 47.6% and by blunt/thrown object at 11%), followed by cut/pierce (7.0%) and firearms (1.3%); the mechanism was not specified in the coding for one-third (32.5%) of assault-related injuries
- The highest rates of assault-related injuries were among young adults 20 – 24 years (981.3 per 100,000 population), followed by 15 – 19 years (832.2 per 100,000 population) and 25 – 29 years (707.2 per 100,000 population)
- Assault-related injury rates caused by struck by/against injuries were highest among young adults 20 – 24 years (569.1 per 100,000 population), followed by youth 15 – 19 years (530.4 per 100,000 population) and adults 25 – 29 years (388.5 per 100,000 population).
- Assault-related injury rates caused by cut/pierce injuries were highest among young adults 20 – 24 years (85.1 per 100,000 population), followed by adults 25 – 29 years (72.7 per 100,000 population) and youth 15 – 19 years (48.0 per 100,000 population).
- Assault-related injury rates caused by firearms were highest among young adults 20 – 24 years (20.8 per 100,000 population), followed by youth 15 – 19 years (12.5 per 100,000 population) and adults 25 – 29 years (12.4 per 100,000 population)
- More males (65.1%; 33,441) than females (34.9%; 17,961) were treated for assault-related injuries. The age-adjusted rates of assault-related injuries for males (409.3 per 100,000 population) were 86% higher than for females (220.5 per 100,000 population)
- Assault-related injury rates for Non-Hispanic Blacks (689.4 per 100,000 population) and Hispanics (600.1 per 100,000 population) were five-times and four-times, respectively, higher than for Non-Hispanic Whites (141.3 per 100,000 population)
- **For the five-year period, the total hospital ED charges for assault-related injuries were \$44,054,115, with an average charge of \$543 for each assault-related ED visit**

## Legal Intervention/War

- For the five-year period, there were 2,571 events of legal intervention injuries with an average of 514 per year
- Two-thirds (75%) of these injuries were due to struck by/against followed by poisoning by gas (1.1%), firearms (0.5%) and cut / pierce (0.4%); the mechanism was not specified in the coding for 23% of the legal intervention injuries
- The highest rates of legal intervention injuries were among young adults 20 – 24 years (52.6 per 100,000 population), followed by 25 – 29 years (46.7 per 100,000 population) and 30 – 34 years (33.7 per 100,000 population)
- More males (85.7%; 2,203) than females (14.3%; 368) were treated for legal intervention injuries. The age-adjusted rates of legal intervention injuries for males (27.2 per 100,000 population) were more than six fold higher than for females (4.5 per 100,000 population)
- Legal intervention injury rates for Non-Hispanic Blacks (41.8 per 100,000 population) and Hispanics (35.7 per 100,000 population) were seven and six times, respectively, higher than for Non-Hispanic Whites (6.1 per 100,000 population)
- **For the five-year period, the total hospital ED charges for legal intervention injuries were \$ 1,746,692 with an average charge of \$ 461 for each legal intervention injury ED visit**

Data Source: CT Hospital Association, hospital discharge data (CY 2000 - 2004)

Note: Data set includes 29 out of 31 non-federal, acute-care, inpatient hospitals in Connecticut; for the five-year period, it's estimated that less than 2% of the state injury events were hospitalized in these two hospitals.

\* Injury-related emergency department visit is defined as a treat-and-release of a patient from a hospital emergency department.

-- Matrix is based on the CDC "Recommended framework of E-code groupings for presenting injury mortality and morbidity data (February 1, 2007)" (<http://www.cdc.gov/ncipc/whatsnew/matrix2.htm>). Diagnostic categories are based on the *International Classification of Diseases, 9th Revision, Clinical Modification* (ICD-9-CM). Injury cases are identified by the nature-of-injury codes (N-codes) listed in the principal diagnosis field: 800-999. Injury indicator case counts are then based on the first-listed valid external cause-of-injury code (E-code), excluding E849, E869.4, E870-E879, E930-E949, and E967. This framework does not provide for intentionality for certain injury categories as indicated by gray shading.

\*\* Rates per 100,000 population. Rates based on counts < 20 may be unstable and should be interpreted with caution. Rates provided here are not age-adjusted and may differ slightly from other department publications.

Note: Number of ED visits represent number of events, not number of individuals that visited the hospital emergency department.

-- Population data: DPH, CT registration reports (Table 1), state-level bridged race estimates.

<sup>1</sup> Unintentional Injuries: ICD-9-CM Codes E800-E869, E880-E929;

<sup>2</sup> Assault: ICD-9-CM Codes E960-E969, E979;

<sup>3</sup> Self-Inflicted Injuries: ICD-9-CM Codes E950-E959;

<sup>4</sup> Legal Intervention / War: ICD-9-CM Codes E970-E978, E990-E999;

<sup>5</sup> Undetermined Intent: ICD-9-CM Codes E980-E989.

a In keeping with confidentiality regulations, numbers and rates are not disclosed for < 6 events. Additional counts may be censored in order to preserve the confidentiality of adjacent cells.

Recommended framework of E-code groupings for presenting injury mortality and morbidity data (February 1, 2007)

<hr/>					
<b>Adverse effects</b>					E870-E879 E930.0-E949.9
<b>Medical care</b>					E870-E879
<b>Drugs</b>					E930.0-E949.9
<b>All external causes</b>					E800-E999

<sup>1</sup>Includes legal intervention (E970-E978) and operations of war (E990-E999).

<sup>2</sup>Three 4th-digit codes (.4 [occupant of streetcar], .5 [rider of animal], .8 [other specified person]) are not presented separately because of small numbers. However, because they are included in the overall motor vehicle traffic category, the sum of these categories can be derived by subtraction.

<sup>3</sup>Codes in bold are for morbidity coding only. For details see table 2.

<sup>4</sup>E849 (place of occurrence) has been excluded from the matrix. For mortality coding, an *ICD-9* E849 code does not exist. For morbidity coding, an *ICD-9-CM* E849 code should never be first-listed E code and should only appear as an additional code to specify the place of occurrence of the injury incident.

**Note:** ICD-9 E codes for coding underlying cause of death apply to injury-related death data from 1979 through 1998. Then there is a new ICD-10 external cause of injury matrix that applies to death data from 1999 and after. This can be found on the [National Center for Health Statistics website](#).

## Technical Notes

### Data Sources <sup>2</sup>

Emergency Department dataset was obtained from Connecticut Hospital Association (CHA) with complete hospital emergency department discharge/treat-and-release (Connecticut Health Information Management & Exchange - CHIME) data from 29 of the 31 non-federal, acute-care, inpatient facilities in the state, for calendar years 2000 – 2004. Complete data for Milford Hospital were not available. Data for January 1, 2000 – September 30, 2000 were only available for Milford Hospital and were included in the analysis. There are no data available for Sharon Hospital because it does not participate in CHIME. It is estimated that for the five-year period, less than 2% of the state injury events were hospitalized in these two hospitals.

The injury-related emergency department treat-and-release dataset includes all Connecticut residents from twenty-nine – out of the 31 – hospitals who visited the emergency departments for injury-related events during calendar years 2000 – 2004 with a principal diagnosis of injury, plus a valid external cause-of-injury code (E-code). Multiple emergency department visits are included, and hence, the data are not de-duplicated. Numbers of emergency department visits represent number of events, not number of individuals visited emergency department for injury-related events. During this five-year period, of the 1,666,184 patient records with an injury diagnosis, 97% (1,620,449) included a valid E-code.

Classification of injury morbidity data: <sup>3</sup> Injury hospital discharge records are included for analysis based on the creation of a subset of all hospital discharge records for a given calendar year(s), selected to meet the following three criteria:

- Have been admitted and released at the emergency department
- Have an injury diagnosis, ICD-9-CM, (nature-of-injury codes 800.0-999) listed in the principal diagnosis field; plus,
- A valid external cause-of-injury code, ICD-9-CM, (E-codes E800-E999, excluding codes E849, E967, E869.4, E870-E879 and E930-E949) listed in any one of the additional diagnosis fields.

If more than one external cause code is listed for a given patient record, only the first valid E-code listed in the diagnostic code fields is reported. [Connecticut hospital discharge records currently include 10 diagnostic code fields; unlike many other states, Connecticut does not include a dedicated E-code field.] If the first E-code is invalid, or is E849, E869.4, E870-E879, E930-E949 or E967, the next valid E-code listed in the diagnostic code fields is used.

### Calculation of Rates

Rates per 100,000 population are calculated by dividing the number of ED visit events in a particular population by the total number of people in that population, then multiplying that ratio by 100,000. For example, in order to determine the ED visit rate for a specific age group, the age-specific ED visit rate is calculated, as follows:

---

<sup>2</sup> A note on ICD codes: the *International Classification of Diseases, 9<sup>th</sup> Revision, Clinical Modification*, was used for coding both morbidity and mortality data from 1979 through 1998, and continues to be used for coding morbidity data; however, the *ICD 10<sup>th</sup> Revision* is used for coding mortality data from 1999 and after. Thus care must be taken when making comparisons between data coded under different versions of the ICD due to changes in case definitions; revisions to these codes are implemented in October of each year.

<sup>3</sup> *Ibid*, p. 9.

Age-specific ED Visit Rate =  $\frac{\text{Number of ED Visits in a specific age group}}{\text{Total population in that specific age group}} \times 100,000$  population

The number of ED Visits in a specific age group, per 100,000 population in the same age group.

## Age-adjusted Rates

Age-adjusted or standardized rates are calculated in order to rule out the effects of any age differences between two or more populations that are compared. Normally, a hypothetical or a “standard” population is used, in this case, the standard 2000 US population. For example, if the injury ED visit rates of two Counties are compared, the one with higher adult populations would probably exhibit higher fall injury ED visit rates, or if bicycle injury rates of two communities are compared, the community with more young children would probably have higher injury bike rates, therefore, age-adjusted rates are computed in order to make the two county or community populations similar in regards to age distribution, that their rate differences are explained by other factors, not by age differences.<sup>4</sup>

### Confidence Interval

95% confidence interval is calculated for the rates. 95% of the time the true rate is contained within the calculated rate interval, and 5% either higher or lower than the rate of the confidence interval.

## Race & Ethnicity

Ethnicity: It is noted that “Hispanic” is not a race, but rather refers to people whose origins are from Spain, Mexico and the Spanish-speaking countries of Central America, South America, and the Caribbean islands; individuals of Hispanic origin can be of any race. (“Origin” includes ancestry, nationality and lineage.)

Race: Race is defined as “a population of individuals who identify themselves from a common history, nationality, or geographical place”.<sup>5</sup> A decedent’s race is outlined in CHIME according to the following categories: White, Black, Oriental/Asian, American, Spanish/Hispanic, Other Race, Pacific Islander/Hawaiian, Other Non-White, Unknown.

## Definition of ICD Terms & Categories <sup>6</sup>

### Mechanism and intent of injury:

Mechanism of injury: the mechanism, or cause, of injury is the way in which the person sustained the injury, how the person was injured, or the process by which the injury occurred.

Intent of injury: the intent, or manner, of injury is whether an injury was caused by an act carried out on purpose by oneself [self-harm or suicide], or by another person(s) [assault or homicide], with the goal of injuring or killing.

### Injury categories by mechanism or cause:

Cut / pierce / stab: injury resulting from an incision, slash, perforation, or puncture by a pointed or sharp instrument, weapon or object. This category does not include injury from being struck by or against a blunt object or bite wounds; these injuries fall in the category “struck by/against”.

Drowning / near drowning / submersion: suffocation (asphyxia) resulting from submersion in water or another liquid.

Fall: injury received when a person descends abruptly due to the force of gravity and strikes a surface at the same or lower level.

Fire / burn / smoke inhalation: severe exposure to flames, heat or chemicals that leads to tissue damage in the skin or places deeper in the body; injury from smoke inhalation to the upper airway, lower airway or lungs.

Firearm gunshot: a penetrating force injury resulting from a bullet or other projectile shot from a powder-charge gun. This category includes gunshot wounds from powder-charged handguns, shotguns and rifles. This category does not include injury caused by a compressed air-powered paint gun or a nail gun, which falls in the “other specified” category.

Inhalation / ingestion / suffocation: inhalation, aspiration or ingestion of food or other object that blocks the airway or causes suffocation; intentional or accidental mechanical suffocation due to hanging, strangulation, lack of air in a closed place, plastic bag or falling earth. This category does not include injury resulting from a foreign body that does not block the airway.

Machinery: injury that involves operating machinery, such as drill presses, fork lifts, large power-saws, jack hammers, and commercial meat slicers. This category does not include injury involving machines not in operation, falls from escalators or moving sidewalks, or injuries from powered lawn mowers or other powered hand tools or home appliances.

Natural / Environmental: injury resulting from exposure to adverse natural and environmental conditions, such as severe heat, severe cold, lightning, sunstroke, large storms, and natural disasters, as well as lack of food or water.

Other specified causes: injury associated with any other specified cause that does not fit another category. Some examples include causes such as electric current, electrocution, explosive blast, fireworks, overexposure to radiation, welding flash burn, or animal scratch.

Overexertion: working the body or a body part too hard, causing damage to muscle, tendon, ligament, cartilage, joint or peripheral nerve (e.g. common cause of strains, sprains and twisted ankles). This category includes overexertion from lifting, pushing or pulling, or from excessive force.

Poisoning: ingestion, inhalation, absorption through the skin, or injection of so much of a drug, toxin (biologic or non-biologic), or other chemical, that a harmful effect results, such as drug overdoses. This category does not include harmful effects from normal therapeutic drugs (i.e. unexpected adverse effects to a drug administered correctly to treat a condition) or bacterial illnesses.

---

<sup>6</sup> WISQARS definitions. <http://www.cdc.gov/ncipc/wisqars/>

Struck by / against or crushed: injury resulting from being struck by (hit) or crushed by a human, animal or inanimate object or force other than a vehicle or machinery; injury caused by striking (hitting) against a human, animal or inanimate object or force other than a vehicle or machinery.

Transportation-related causes: injury involving modes of transportation, such as cars, motorcycles, bicycles and trains. This category is divided into four sub-categories according to the person injured: motor vehicle occupant, motorcyclist, pedal cyclist, pedestrian and other transport. This category also involves another factor: whether the injury occurred in traffic (i.e. on a public road or highway).

Unknown / unspecified cause: injury for which the emergency department [hospital or other] report does not provide enough information to describe the cause of injury.

Intentional injury categories:

Suicide / self-inflicted injury: intentionally self-inflicted injury that results in death or injury (attempted suicide).

Homicide / assault: injuries inflicted by another person with intent to injure or kill, by any means. Excludes injuries due to legal intervention and operations of war.

Legal intervention: injuries inflicted by the police or other law-enforcing agents, including military on duty, in the course of arresting or attempting to arrest lawbreakers, suppressing disturbances, maintaining order, and other legal actions. Excludes injuries caused by civil insurrections.

Operation of war: injuries to military personnel or civilians caused by war or civil insurrection, including those occurring during the time of war or insurrection and after cessation of hostilities.

Transport-accident categories:

Transport accident: any accident involving a device designed primarily for, or being used at the time primarily for, conveying persons or goods from one place to another.

Public highway: land open to the public as a matter of right or custom for purposes of moving persons or property from one place to another.

Traffic accident: any vehicle accident occurring on the public highway. A vehicle accident is assumed to have occurred on the public highway unless another place is specified, except in the case of accidents involving only off-road motor vehicles, which are classified as non-traffic unless the contrary is stated.

Non-traffic accident: any vehicle accident that occurs entirely in any place other than a public highway.

Pedestrian: any person involved in an accident who was not at the time of the accident riding in or on a motor vehicle, railway train, streetcar, etc.

Pedal cycle: any land transport vehicle operated solely by pedals.

Pedal cyclist: any person riding on a pedal cycle or in a sidecar or trailer attached to such a vehicle.

Motorcycle rider: any person riding on a motorcycle or in a sidecar or trailer attached to such a vehicle.

\* Rates = per 100,000 population. (Rates based on counts < 20 may be unstable and should be interpreted with caution.)

\*\* 95% confidence interval (counts < 20 may be unstable and should be interpreted with caution.)

a In keeping with confidentiality regulations, numbers and rates are not disclosed for < 6 events. Additional counts may be censored in order to preserve the confidentiality of adjacent cells.

\* Rates = per 100,000 population. (Rates based on counts < 20 may be unstable and should be interpreted with caution.)

\*\* 95% confidence interval (counts < 20 may be unstable and should be interpreted with caution.)

a In keeping with confidentiality regulations, numbers and rates are not disclosed for < 6 events. Additional counts may be censored in order to preserve the confidentiality

† Data tables by year have been omitted due to the high numbers of censored small cell counts (<6 events).

\* Rates = per 100,000 population. (Rates based on counts < 20 may be unstable and should be interpreted with caution.)

\*\* American Indian / Alaskan Native

† Asian / Pacific Islander

‡ Note: Rates by sex for County of Residence are estimated rates only, based on U.S. Census Bureau population estimates for 2000 - 2004, and may differ slightly from other CT DPH population figures for this variable.

\* Rates = per 100,000 population. (Rates based on counts < 20 may be unstable and should be interpreted with caution.)

\*\* American Indian / Alaskan Native

† Asian / Pacific Islander

‡ Note: Rates by sex for County of Residence are estimated rates only, based on U.S. Census Bureau population estimates for 2000 - 2004, and may differ slightly from other CT DPH population figures for this variable.

a In keeping with confidentiality regulations, numbers and rates are not disclosed for < 6 events.
