Executive Summary

The goal of this study is to assess the institutional demand for regionally grown ground beef; analyze the logistics and infrastructure required to support such demand; and if feasible, propose a model that could be replicated amongst the New England states to source, process, market and distribute regionally grown ground beef to institutions.

The study concluded that:

- There are opportunities for growth in the use of local beef in institutional markets in all six New England States
- The bulk of the need (86%) is for raw, bulk ground beef, with no additional processing (pasteurizing, cooking, spicing, shaping, or scoring) required
- Two models are currently in use that could be replicated on a regional basis to service this demand.

Conclusions

Buyers and price sensitivity

Within this market segment we discovered two distinct audiences:

- 1) Buyers who have more autonomy and decision-making control, whose primary decision making factors are the animal management practices used to produce the beef they are buying and a desire to support the local economy. These are buyers who are willing to make the effort to seek out local beef if it is available. These buyers are largely hospitals, higher education institutions, and private establishments.
 - 29% of the respondents said they would prefer to buy their locally sourced product direct from a producer.

These buyers have a maximum price threshold of \$4-5/lb for locally sourced ground beef.

2) Buyers who are price sensitive and driven by routine. Buyers whose primary purchasing decision making factors are price and the degree to which the product is incorporated into their existing order and purchasing mechanisms. These buyers are largely K-12 schools, higher education, and food service management companies, and the distributors that service them.

53% of the respondents said they would prefer to buy their locally sourced product from their distributor.

These buyers price sensitivity hovers around \$2-3/lb.

Market Size, Scope - Buyer Responses Extrapolated to Total Institutional Population

Survey respondents represent 8% of the total institutional population in New England. Survey respondents utilize a total of 495,264 pounds of ground beef annually. Of this, respondents noted that they would purchase up to 25% of their total volume needs from a local source if the source could hit a \$2-3 per pound price point. According to respondents, 86% of their demand is for un-pasteurized, un-cooked, bulk, ground beef.

If one extrapolates this to the total institutional population base, 495,264 pounds equals 8% of 6,190,800 pounds. Therefore total annual New England institutional demand for ground beef approximates 6,190,800 pounds. 86% of the total institutional demand, 5,324,088 pounds is for bulk, ground beef. 25% of 6,190,800 pounds equals 1,547,700 pounds.

This means at \$2-3 per pound, the initial size and scope for a local beef to New England institutional market equals 1,547,700 pounds per year of which 1,331,022 pounds is raw, bulk ground beef.

If one assumes the average 3-5 body condition dairy or non-freezer trade grade beef represents 384 pounds of ground beef,¹ then this market has the potential to divert up to 4,030 regional culls into the New England institutional food supply on an annual basis.

The table on the next page lists each state's price sensitivity threshold and the institutional market segments that support that price point. This table can help processors and producers evaluate potential geographic regions, types of institutions, and products to serve and conduct financial analysis to evaluate the feasibility for their enterprise.

Models

In our research we found examples of both price sensitive audience's and source sensitive audience's ground beef needs being met by a local product. Two models stood out as being replicable on a regional scale, a producer-driven model that is designed for the buyer with decision making control and a proactive desire to source local beef, and a processor-driven model designed to service the institutionalized process and price driven buyers. The models create opportunities for both beef producers and dairy farmers, as well processors in all six New England states.

The producer-driven model

- 1) is limited in its ability to create widespread regional impact on the amount of local beef sold to institution markets
- 2) is best suited for small scale volume producers:
 - who want to be involved in the sales transaction
 - for beef and dairy producers who are engaged in retailing beef and have direct sales channels for other cuts from the animal
 - for producers who are charging a premium for their product

institutions:

- who are actively seeking local food
- who want to take the time to develop a direct connection to the producer
- who value specific attributes of the beef they buy, such as grass fed

 who have a flexible cost structure or budget to pay a premium for those attributes and the relationship.

The producer-driven model requires the producer to be the point person selling the product, and coordinating its processing and delivery. The producer-driven model offers the most opportunity for educational outreach and community building because of the direct connection between the farm and the buyer; it also offers the greatest opportunity for profitability for the producer. The producer-driven model also presents the greatest logistical hurdles, it is time consuming and complicated on the buyer end, it is time consuming and complicated on the producer end, it can be difficult to secure processing services, and variability in quality of those services can be damaging to the long-term success of the business relationship.

Producer-Driven Model

Pros:

- Can provide direct sale profit margins for producers
- Premium product for buyer
- Ability for secondary benefits such as community education/ag education/food education
- Ability to "Know Your Farmer"
- Ability to develop direct, long lasting relationships
- Ability to make a deep, meaningful impact on a narrow audience of producers and institutions

Cons:

- Time consuming for producer and for buyer
- Small scale/single animal transactions
- May not be of value to beef producers who command a higher price point than even committed institutions with discretionary budgets can afford
- Will not alleviate the issue of dairy culls being shipped out of state and resold back as commodity ground beef
- Dependent on processor availability/quality of services
- Will make a significant impact on a few individuals but by and large will not benefit the majority of the producer or institutional population

The processor-driven model

- 1) offers the majority of the opportunity for regional beef to enter the institutional market.
- 2) is best suited for:

farms:

- that have culls as a cost center and need to find the most efficient and economical return on investment for them.
- that are not seeking diversified markets or new enterprises.

buyers:

• That are price and process driven institutional buyers who may value the concept of buying local but whose budgets and routine still dominate their decision making.

processors:

- who are seeking opportunities to create markets for themselves
- who have established sales channels and markets
- who are interested in expansion or optimizing efficiency and return on assets of existing infrastructure
- who are resourceful

In this model, the buyer-seller relationship is anchored around the processor and the institution or wholesaler servicing the institution. The processor-driven model presents several advantages to serving the institutional market. These advantages enable the processor-driven model to overcome five otherwise insurmountable hurdles to large scale penetration of the institutional market:

- 1) Sufficient volume of product
- 2) Streamlined ordering and delivery system
- 3) Access to processing services
- 4) Cost efficient processing
- 5) Ability to compete on price

Processor-driven model advantages:

Access to unlimited raw materials

The average annual cull rate on conventional dairies is one third of the mature dairy head. The cull rate reported from the producers interviewed for this research ranged from 19% for dairy to 2% for beef. At the time of this report, New England had 216,100 mature dairy, not to

mention its beef herds. Even at a 19% cull rate, this represents 41,059 culls available to supply local demand, more than sufficient to meet the 4,030 cull needs on the institutional market. While 4,030 culls may be difficult for any one producer or group of producers to coordinate, processors have connections and relationships with a wide network of farms in their area, thus they have are well suited to initiate outreach and source culls as needed to meet buyer demand. Unlike producers, they are not limited by a single farm's production. Because of this, the processor-model immediately resolves issues of insufficient volume and provides a streamlined sales channel for the buyer.

Control of Processing Services

Because the processor also controls the processing services, they have the ability to resolve issues three through four at their discretion. By having authority over the processing schedule, the processor can elect to work overtime, evaluate the financial feasibility of expanding hours/days of kill floor use and cutting, and analyze the schedule to fit these animals in on slow days as ways to service the new market without compromising service to existing customers.² By controlling the cut sheet, the processor can create a cut sheet aimed at optimizing efficiency and turning out volume, further creating processing efficiencies. Cut time for a custom cutsheet can reduce productivity by 50% or more, slowing the process from one hour to two or more hours per animal.³

Existing Sales Channels for Prime Cuts

According to the processors interviewed 50% of their volume is built around their own private label products in which they buy animals and resell the meat. Processors are experts at efficiently processing animals and harvesting all usable parts for sale. Their core competency is on processing and selling meat, in a business built around tight margins, it will be more effective for long term success and regional replicability for the processor to handle the responsibility of selling and marketing the remainder of the carcass to finance an institution's purchase rather than requiring the buyer or producer to assume the role.

²Willingness to work after hours on such a project was cited from conversations held with processors, including Herring Brothers Meats and Adams Farm, June 2011.

 $^{^3}$ Cut times cited from conversation with Bill Tripp Locust Grove Farm, NY June 23, 2011.

Processor-Driven Model

Pros:

- Improved (albeit marginal) price for culls to producer
- Competitive price for buyer
- Marginal per unit profit, but high volume for processor
- Ability to increase processor volume, improving return on assets, increasing cash flow, increasing retention and expansion of trained staff
- Ability for processors to automate the process to optimize efficiencies and potential for profitability
- Has the potential to make a broad impact to a large percentage of producers, processors, institutions
- Has the ability to redirect dairy culls to stay local
- Streamlines ordering procedures and ease of access for buyershigh volume single point of contact

Cons

- Sourcing regional beef does not fit most food service buyers' current business models resulting in little to no demand thus will be a slow market adoption process requiring market development, someone to push the effort
- Will never be a high margin business

While the processor-driven model does not represent significant monetary gain to farms or processors, it does present the opportunity for dairy farms to receive a better price for their culls than the traditional options currently at their disposal because it will pay the going commodity rate, without deducting commission or trucking fees, and since the animals' destination is local, they will likely arrive less dehydrated and in better condition, yielding a better live weight. For processors it represents the opportunity to make marginal profit per unit, but with a high turn-over potential, thus reasonable increase to overall income over time. This increase in work flow will also improve return on assets, increase year round cash flow, and encourage retention and expansion of trained work staff and hours of operation.

The processor-driven model works when the price point, including any distributor mark-up, falls within an institution's price sensitivity range. This range will be largely based on the current commodity pricing for ground beef, the type of institution, and the volume the institution is buying. The range will fluctuate up and down corresponding to the market. The feasibility for a

processor to be successful in this market will depend on operating expenses and the ability to derive income from the other parts of the animal. In general, what the processor charges per pound for the ground beef needs to at a minimum cover the cost of purchasing and processing the animal. The opportunity for profit will come from the income received for the other cuts of the animal. Theoretically, the main variable affecting the price of ground beef is the price paid for the animal. This occurs when the processor's operating expenses and volume of ground beef to live weight ratio stay relatively constant, and the spread between the price paid for the animal and the price charged for the ground beef covers the operating expenses. On average this is also the single variable affecting the price fluctuations of the global market. As long as the local product is competitive at any one point and time, it should remain competitive at any and all times, even with global market fluctuations because it will be trending up and down in a static ratio to the global market price at a ratio that has already been deemed acceptable by the buyer.

Financial viability will therefore be dependent on the spread between the going rate for culls, the going rate for ground beef, and the spread needed in between for the processor and distributor to break-even/make a profit. In general the processor/price sensitive driven model can work as long as:

- the processor can generate break even or better off the ground beef and generate profit from harvesting and selling other parts of the carcass such as tenderloins and rib eyes.
- the price to institution including any distributor markup can still hit the \$2.00-3.00/lb price range for bulk ground beef.

Hurdles/Making It Happen

Up until now, the effort to increase sourcing of local ground beef into the institutional market has been largely accomplished on an individual basis. Until stake holders decide to push (invest the time and energy to cultivate the markets), and buyers decide to pull (demand local product), distributors and food service management companies will not allocate resources to supporting local ground beef, and the effort will be of little impact.

Katherine Sims of the Green Mountain Farm to School Network expressed it this way: "We still need to actively reach out to schools with access to locally grown ground beef; the schools are not yet begging for it." Unless there is buyer demand, distributors will not push the product because warehouse space is limited and priority is given to products with high turnover. ⁵

⁴Louise Calderwood conversation with Katherine Sims, August, 2011.

⁵Distilled from conversations with distributors, including Sysco, August 2011.

To capitalize on the opportunities and encourage large scale, regional adoption, significant investment in time and resources will be required for market development. Because of low profit margins it is unlikely that any effort could be driven long term by a third party, but as producers and processors may already have limited access to manpower and financial resources, having initial assistance from a third party to drive market acceptance and create pull would greatly expedite the rate of acceptance along the supply and demand chain.

Trends

With respect to trends, the study found minimal difference in responses by state. Rather the differences were found to be from the type of institution and producer responding. For example, regardless of what state was being researched, price was volume dependent. Hospitals currently demand the least volume of ground beef, and were paying the most, followed by colleges who used more than hospitals but who paid less than hospitals, and K-12 who used the most and paid the least. Similarly, regardless of state, the producers fell into two groups: dairy producers who have culls as a by-product of their primary operation and who try to minimize their sunk cost when they discard these assets; and beef producers whose profit centers around their beef animals, who have few non-prime animals, and who are selling even their non-prime beef for a premium.

There were two exceptions to a general lack of geographic trends:

- 1. Vermont's institutions had a higher price sensitivity threshold than the other states.
- 2. Rhode Island institutions by and large did not participate in the research.

Perhaps Vermont's price threshold can be at least partially attributed to the attention being given to local food through recent initiatives such as the statewide buy local campaign, the burgeoning localvore movement, and the various recent studies centered on the local agricultural economy. It may be that over time these have begun to influence a change in the customer mindset regarding buying local, price sensitivity, and qualitative properties of the products they purchase.

With respect to Rhode Island, it is believed that the higher prevalence of the use of contracted food service companies was what led to zero completed responses, and that this could signify or exemplify the disinterest of outsourced food service providers in altering existing business models to accommodate local or regional meat.

Findings

Producers

From the producers interviewed, which included a sampling from organic and conventional beef and dairy, small and large herds across each state, the conclusion is that producers,

whether beef or dairy, selling culls or prime animal, have two primary decision making factors they use to gauge new markets/outlets: price and the value of their time.

On average, producers interviewed offered \$0.65/lb live weight as a fair price for dairy culls and \$0.81/lb live weight for non-prime beef animals. Given the present value-proposition for engaging the institutional market is only marginally better or equivalent to the current outlets producers have at their disposal it is not worth a producer's time to pursue unless the buyers and processors initiate the transaction.

In ending comments, many of the producers contacted expressed similar hopeful sentiments for providing local beef to the community. Their comments tempered hope with caution and skepticism from experience. In general, producers interviewed were interested in the project and longed for local institutions to serve local beef to their communities, mentioning children, other family members, and friends who eat at such institutions as personal reasons why they would like local meat to be served.

Processors

Similar to the producers, processors expressed skepticism mixed with a sense of hope that this could work out. They were aware of the reality of the commodity driven landscape, yet maintained a personal and empathetic desire to be able to keep things local if it were possible.

"I do think there is a need for this, if it could happen. We are shipping loads and loads of beef out of New England, and it should stay here, because it comes back here anyway. There is a need to keep things local." ⁶

Processors do feel that even with their existing infrastructure they could increase what they are doing and fulfill some institutional volume. They are used to working on margins and are not only looking at the profit this opportunity represents but how it might boost other elements of their business for over-all improved viability. A proven processor-driven model that can be replicated and is in use in at least two states with favorable outcomes reported for all parties is one in which the processor buys in animals for resale, develops relationships with the buyers or distributors, services their needs, and harvests other elements of the carcass for resale to help make the model financially viable while remaining within the institutional market's price sensitivity for ground beef.

⁶ Kate Rumley telephone conversation with Arnold Luce, Luce's Maine Grown Meats, June 27, 2011.

Two examples of the Processor-Driven Model are presented for Financial Analysis

Processor 1 in 2011 was

- o paying \$0.80/lb live weight
- o charging \$2.15/lb for 80:20; \$2.25/lb for 85:15
- average spread to cover operating expenses = \$1.40/lb;
- o 27% of income came from non-ground beef product sales
- o distribution: some institutions retrieve the product themselves, others use a wholesaler who applies a 12-15% mark up (\$.34/lb).
- Total cost of ground beef to institution: \$2.15-\$2.59/lb

Processor 2 in 2010 was

- o paying \$0.61/lb live weight
- o charging \$2.30/lb
- average spread to cover operating expenses = \$1.69/lb
- o 14% of income came from non-ground beef product sales
- o regular K-12 wholesaler stored and delivered the meat, potential surcharge to school of 12% (\$.27/lb).
- Total cost of ground beef to institution: \$2.30-2.57/lb

Distributors

While distributors maintain large, efficient warehouses, their business models require rapid movement of goods in and out of their buildings. Sales staff make frequent requests for the addition of new items into the product line offered, however, the products that receive attention and longevity in the line-up are those that can demonstrate demand and high turn-over. To date, locally sourced fresh ground beef for the institutional market has not been in high enough demand to warrant strong consideration and push by the distributors.

However, if the ground beef providers can meet the buyers' needs, there is opportunity, even in the face of vertical integration within the industry, and the product need not be pasteurized. A simple, fresh, bulk, ground beef will suffice. To provide an example of the degree to which there is opportunity: Sysco owns USDA inspected facilities for in-house fabrication of meat products, however, due to liability concerns it refuses to produce its own ground beef. Ground beef is one of the few products in which distributors want to maintain a clear demarcation between their company and ground beef processing, and given this, they are more than willing to work with outside vendors.

Institutions

Of the three institutional market segments, the healthcare industry represents the easiest point of entry for both producers and processors. There are several reasons:

- Hospitals appear to be early adopters
- They have the highest price point and elasticity
- From large scale to small scale (less than 100 beds to greater than 250 beds) they are interested in local beef.
- They are aware of the potential health benefits of certain types of meat and are willing to pay a premium for these attributes.
- They are evenly split between those who want to buy direct and those who want to buy through a distributor.
- They tend to have more autonomy and are independently managed.

While hospitals represent the easiest point of entry for both the producer and processor-driven models, they represent the smallest volume needs of the institutional market and therefore higher education and K-12 should not necessarily be overlooked.

The bottom line is, if we extrapolate out the survey results to the entire New England Institutional Market:

- 1. 29% of the institutional population is seeking a direct relationship with a producer and has a sensitivity threshold that can reach as high as \$4-5/lb for ground beef, if the product has certain attributes such as single source, grass fed, certified organic, etc.
- 2. 53% of the institutional population is interested in purchasing local product with local being the key attribute, if it came from their existing distributor.
- 3. The total New England institutional market uses approximately 6.2 million pounds annually.
- 4. Institutional buyers are willing to replace up to 25% of their total volume, representing an opportunity to source up to 1.55 million pounds, with a locally sourced product if suppliers can hit a \$2-3/lb price point.
- 5. 86% of this volume, 1.33 million pounds is purchased as bulk, ground beef, requiring no further processing (no pasteurizing, shaped and formed, cooked, flavored, etc).

Recommendations

Based on the conclusions, the research recommendations are as follows:

Needs

1. Processor Enterprise Analysis

To ensure as positive and successful a long-term outcome as possible, it is important for each processor to make certain it makes financial sense for them before focusing on the institutional market. It is recommended that business planning/financial consultants be hired to assist processors evaluate the opportunity one-on-one, as it pertains to their business.

Key questions:

- 1. what are their per unit operating expenses?
- 2. would the spread between what they paid for the animal and what they could charge to the institutions for the ground beef cover their per unit operating expenses?
- 3. Do they have outlets for any other cuts they could salvage, what are the price points they could receive for those products, and any costs associated with selling them?
- 4. What is the net per unit income potential from the processor-driven model for this particular business? Is it break-even or better?

2. Market Development

- Facilitate Processor Outreach
 Assist processors connect with the buyers and distributors in their area to assess market demand, and begin the sales relationship process. Continue to cultivate product demand and awareness, and nurture the buyer-seller relationships through on-going outreach to processors, distributors, and institutional buyers.
- Facilitate Producer Outreach
 Conduct outreach to producers raising beef for direct sale and present them with the opportunity to make outreach to interested institutional buyers in their area. Assist them with connecting the dots with the buyers seeking a direct connection to the farmer. Focus on buyers and distributors in Higher Education and Hospitals.
- Affect long term change through championing revisions to the commodity bid program
 in the Farm Bill at the federal level. If New England wants to encourage local
 agricultural economic development, it must look at bottlenecks in the larger system and
 how they can be overcome.

Advocate for the following changes:

- 1. The commodity bid program could be broken into a state by state bidding process. Having each state as a separate bid enables all businesses both large and small, local and non-local, the opportunity to bid. With the current bidding process, bids are not broken out by state or region, precluding small or regional businesses from participating. Having each state as a separate bid will encourage local businesses to consider serving the needs of their states and surrounding states.
- Advocate for a definition for micro-enterprises for beef processing. At present the
 commodity bid program gives preference to "small businesses" but the designation
 for a small meat processing business is 500 employees. This definition is still far
 larger than any of the processors in New England, and provides no advantage.

Action Plan & Budget

1. Secure funding for each interested processor to conduct an enterprise analysis/feasibility study for entering the institutional market

Cost: \$4,000-10,000 per processor

2. Hire Agency of Agriculture Staff or coordinate with another third party entity to assist with market development. Goal: to expedite adoption of the producer and processor driven models by both the buyers and suppliers.

Tasks include:

- outreach/networking (marketing and logistics facilitation) to processors, distributors, and institutional buyers to begin the conversation of the processor driven model, create awareness and demand, and assist individuals overcome hurdles
- outreach/networking to producers to disseminate the report with the list of prequalified prospects for direct sale, and assist them with communication and overcoming hurdles.
- Work with K-12 to help schools creatively allocate commodity and non-commodity dollars.
- Advocate supporting and encouraging changes to the Farm Bill as recommended.
- Should changes in the Farm Bill be implemented,
 - educate processors about the opportunities
 - o assist them with the bidding procedures
 - provide education and outreach to institutions to make them aware when local suppliers are available and are bidding on state or regional bids.

Cost: 1.0 FTE at a (Vermont) state employee pay grade of 21.

Fixed Expenses

Salary and Benefits \$60,000 Travel, estimate 200 miles per week at \$0.48/mile \$5,000 \$65,000

Contacts for Next Steps

On the following five pages readers will find contact information for individuals interviewed who were interested in participating in either supplying or purchasing local ground beef. The information is in table format. For producers, processors, and distributors there is a column indicating which model each individual would prefer to operate under. For all audiences there are columns identifying how the individuals might wish to be involved in helping launch this initiative, from passive participant to leading the effort.

Please note that the contacts list is not by any means exhaustive. It does not represent the entirety of any audience's total population base. There are institutions, processors, and producers who may not have been contacted or who may not have responded to the survey who may be interested in pursuing this market.

This list is intended as a template and an active database that can be added on to and updated to facilitate networking by providing a pre-qualified list of market prospect leads for processors and producers, and by providing a pre-qualified list of supplier contacts for proactive buyers.
